

Step 1: Fork the Code from GitHub

Render connects directly to your Git repository to build and deploy the app.

1. Login to Github (use Google to login)
2. Fork the repo <https://github.com/just-joseph/ik-agentic-deployment-render/> to your Github.

Step 2: Deploy on Render

Once your code is on GitHub, the deployment process takes just a few minutes.

1. Go to Render and create a free account, using the same Google account.
2. Click New in the dashboard and select Web Service.
3. Under "Connect a repository", authorize your GitHub account and select the repository you just created.
4. Fill in the deployment details:
 - Name: Give your app a name (e.g., review-genie).
 - Region: Choose the one closest to you.
 - Branch: main (or whichever branch you pushed to).
 - Runtime: Python 3.
 - Build Command: pip install -r requirements.txt
 - Start Command: python app.py
5. Select the Free instance type.
6. Set Environment Variables: Scroll down to the Environment Variables section and click "Add Environment Variable". Add your API keys exactly as your code expects them:
 - Key: Open_API_Key | Value: sk-proj-...
 - Key: Tavily_API_Key | Value: tvly-...
7. Click Create Web Service.

Render will now pull your code, install the requirements, and launch the app. You can watch the progress in the deployment logs. Once it finishes, Render will provide a URL (e.g., <https://review-genie.onrender.com>) where your Gradio app is live.
